

4.1a EN Composition: Diets Supplemented with Arginine and Select Other Nutrients

Question: Compared to standard enteral feeds, do diets supplemented with arginine and other nutrients result in improved clinical outcomes in critically ill patients?

Summary of Evidence: There were 27 studies reviewed, 5 level 1 studies and 22 level 2 studies. The data from the Bertolini study was not included in the meta-analysis as the control feed was parenteral nutrition, not an enteral formula. The Kuhls 2007 study had two interventions including one comparing enteral nutrition supplemented with arginine plus β hydroxyl methyl butyrate & glutamine (Juven) to standard enteral nutrition alone, the data for which is included in this section. The data pertaining to the second intervention from this study comparing enteral nutrition supplemented with β hydroxyl methyl to standard enteral nutrition alone is described in section 6.5 EN: HMB. There was only one study in which arginine was given without other select nutrients (Tsuei 2004***), hence sensitivity analyses were done without this study.

Mortality: All 27 studies reported on mortality and when the results of the 26 studies (Bertolini 2003 excluded) were aggregated, there was no effect on mortality (RR 1.05, 95% CI 0.93, 1.19, p=0.44, heterogeneity $I^2=0\%$; figure 1a). When a sensitivity analysis was done which excluded the Tsuei study, there also was no effect on mortality (RR 1.05, 95% CI 0.93, 1.19, p=0.46, heterogeneity $I^2=0\%$; figure 1b). A subgroup analysis of high quality studies (score ≥ 8) vs. low quality studies (score < 8) showed that in higher quality studies, diets supplemented with arginine had no effect on mortality when including the Tsuei study (RR 1.08, 95% CI 0.95, 1.23, p=0.23, heterogeneity $I^2=0\%$; figure 1a) and excluding the Tsuei study (RR 1.08, 95% CI 0.94, 1.26, p=0.28, heterogeneity $I^2=0\%$; figure 1b); whereas in lower quality studies diets supplemented with arginine and other nutrients were associated with a trend towards a reduction in mortality (RR 0.76, 95% CI 0.49, 1.16, p=0.20, heterogeneity $I^2=0\%$; figure 1a). The difference between these two subgroups was not statistically significant (p=0.11). When the studies of trauma including the Tsuei study (RR 1.04, 95% CI 0.56, 1.93, p=0.91, heterogeneity $I^2=0\%$; figure 2a) and excluding the Tsuei study (RR 1.00, 95% CI 0.53, 1.88, p=1.00, heterogeneity $I^2=0\%$; figure 2b) vs. non-trauma patients (RR 1.05, 95% CI 0.87, 1.26, p=0.60, heterogeneity $I^2=21\%$; figure 2a) were compared, there were no differences in mortality. The difference between these two subgroups was not statistically significant (p=0.88). When the Tsuei study was considered by itself, there was no effect on mortality (RR 2.57, 95% CI 0.12, 57.44, p=0.55).

Infections: Based on the 14 studies that reported on the number of infectious complications, there was no difference in the rate of infectious complications in the analysis that included the Tsuei study (RR 0.99 95% CI, 0.85, 1.15, p=0.88, heterogeneity $I^2=48\%$; figure 3a) and the analysis that excluded the Tsuei study (RR 0.98, 95% CI 0.83, 1.15, p=0.81, heterogeneity $I^2=52\%$; figure 3b). Subgroup analysis also showed no differences in infectious complications when high quality studies including the Tsuei study (RR 0.99, 95% CI 0.83, 1.17, p=0.87, heterogeneity $I^2=52\%$; figure 3a) and excluding the Tsuei study (RR 0.98, 95% CI 0.81, 1.17, p=0.80, heterogeneity $I^2=59\%$; figure 3b) were compared to lower quality studies (RR 0.97, 95% CI 0.65, 1.45, p=0.89, heterogeneity $I^2=54\%$; figure 3a), and when studies of trauma patients including the Tsuei study (RR 0.86, 95% CI 0.52, 1.42, p=0.55, heterogeneity $I^2=63\%$; figure 4a) and excluding the Tsuei study (RR 0.79, 95% CI 0.41, 1.50, p=0.46, heterogeneity $I^2=71\%$;

figure 4b) were compared to studies of non-trauma patients (RR 1.00, 95% CI 0.86, 1.16, p=0.96, heterogeneity $I^2=45\%$; figure 4a). When the Tsuei study was considered by itself, there was no effect on infectious complications (RR 1.13, 95% CI 0.57, 2.25, p=0.73).

Length of stay: Diets supplemented with arginine and other nutrients had no effect on hospital length of stay when the Tsuei study was included in the analysis (WMD -1.43, 95% -4.95, 2.10, p=0.43, heterogeneity $I^2=83\%$; figure 5a) and when the Tsuei study was excluded from the analysis (WMD -0.94, 95% CI -4.79, 2.91, p=0.63, p=0.63, heterogeneity $I^2=84\%$; figure 5b); or on ICU length of stay when the Tsuei study was included in the analysis (WMD -0.77, 95% CI -2.31, 0.78, p=0.33, heterogeneity $I^2=70\%$; figure 6a) or when the Tsuei study was excluded from the analysis (WMD -0.50, 95% CI -2.17, 1.17, p=0.56, heterogeneity $I^2=72\%$; figure 6b). When the Tsuei study was considered by itself, there was no effect on hospital length of stay (WMD -5.00, 95% CI -16.17, 6.17, p=0.38) or ICU length of stay (WMD -3.00, 95% CI -9.75, 3.75, p=0.38).

Duration of mechanical ventilation: Diets supplemented with arginine and other nutrients were associated with a significant reduction in mechanical ventilation when the Tsuei study was included in the analysis (WMD -1.67, 95% CI -2.95, -0.39, p=0.01, heterogeneity $I^2=63\%$; figure 7a) and a trend towards a reduction when the Tsuei study was excluded from the analysis (WMD -1.40, 95% CI -2.78, -0.03, p=0.05, heterogeneity $I^2=65\%$; figure 7b). When the Tsuei study was considered by itself, there was no effect on duration of mechanical ventilation (WMD -4.00, 95% CI -10.50, 2.50, p=0.23).

Conclusions:

- 1) Diets supplemented with arginine and other nutrients have no effect on overall mortality in critically ill patients.
- 2) Diets supplemented with arginine and other nutrients have no effect on rate of infectious complications in critically ill patients.
- 3) Diets supplemented with arginine and other nutrients have no effect on hospital length of stay and ICU length of stay
- 4) Diets supplemented with arginine and other nutrients may be associated with a reduction in duration of mechanical ventilation in critically ill patients, but the presence of significant heterogeneity limits this inference.

Level 1 study: if all of the following are fulfilled: concealed randomization, blinded outcome adjudication and an intention to treat analysis.

Level 2 study: If any one of the above characteristics are unfulfilled

Table 1. Randomized studies evaluating diets supplemented with arginine and other nutrients in critically ill patients

Study	Population	Methods (score)	Intervention	Mortality # (%)‡		Infections # (%)	
				Arginine	Control	Arginine	Control
1) Cerra 1990	Surgical ICU N=20	C.Random: yes ITT: no Blinding: yes (8)	Impact (see below) vs. Osmolite HN non-isonitrogenous diets	1/11 (9)	1/9 (11)	NR	NR

C.Random: Concealed randomization

NR: Not Reported

ITT: intent to treat

LOS: Length of stay

ICU: intensive care unit

*Mortality data was ITT, data on infections was non ITT

**Bertolini data not included in meta-analysis as control formula was Parenteral Nutrition, not an enteral formula.

*** Tsuei 2004: excluded in sensitivity analyses as only study that gave arginine alone.

***Kuhls 2007: data pertaining to β hydroxyl methyl butyrate (HMB) supplement vs none not shown here, refer to section 6.5 Other EN Formulas for more details

‡ Hospital mortality reported or presumed unless specified

Impact: 12.5 g/L arginine, ω 3 fatty acids, ribonucleic acid and 55.8 gm protein/litre

Immun-Aid: 14 g/L arginine, glutamine, BCAA, ω 3 fatty acids, nucleic acids, Vit E, selenium, zinc and 80gms protein/litre

Perative: 6.8 g/L arginine, ω 3 fatty acids, Vit E, beta Carotene, zinc and selenium and 66 gms protein/litre

Optimaliment: 5.5 g/L arginine, ω 3 fatty acids, VitC, E, beta-carotene and 51 gms protein/litre

Stresson: 9g/L arginine, 13 g/L glutamine, ω 3 fatty acids, Vitamin E, C, beta-carotene, 75g protein/litre

Crucial: 10 g/L arginine, ω 3 fatty acids, VitC, E, 67 g protein/litre.

Neomune 48 g sachet: 2.5 g arginine, 1.25 g glutamine, fish oil, 12.5 g protein (Protein: 20% arginine, 10% glutamine; Fat: 20% fish oil) vs study's prepared formula: 12.5 g/L arginine, 6.25 g/L glutamine, fish oils, 62.5 g/L of protein
