

## 8.0 Parenteral Nutrition vs. Standard care

January 31<sup>st</sup> 2009

### Recommendation:

***Based on 5 level 2 studies, in critically ill patients with an intact gastrointestinal tract, we recommend that parenteral nutrition not be used routinely.***

**Discussion:** The committee noted that the differences in these aggregated results compared to other meta-analyses (Simpson 2005, Peter 2005, Braunshweig 2001, Koretz 2001) were largely due to the difference in the population studied i.e. inclusion of elective surgery and other hospitalized patients. The current aggregated results in critically ill patients suggest no effect on mortality but that PN may be associated with an increase in infectious complications. Given the concerns about the possibility of harm and higher cost associated with PN when compared to standard treatment, the committee decided to put forward a recommendation against its use in patients with an intact GI tract. It is worthy to emphasize that this recommendation applies to the average critically ill patient with an intact GI tract only and does not pertain to patients with a compromised GI tract in whom PN may be indicated. The committee noted that although the results of the meta-analysis do not support the use of PN in critically ill patients, prolonged periods of starvation (> 2weeks) is associated with poor outcomes (Sandstrom 1993).

Values	Definition	Score: 0, 1, 2, 3
Effect size	Magnitude of the absolute risk reduction attributable to the intervention listed--a higher score indicates a larger effect size	0 (mortality) 0 2 (complications)
Confidence interval	95% confidence interval around the point estimate of the absolute risk reduction, or the pooled estimate (if more than one trial)--a higher score indicates a smaller confidence interval	1 (mortality) 1 (complications)
Validity	Refers to internal validity of the study (or studies) as measured by the presence of concealed randomization, blinded outcome adjudication, an intention to treat analysis, and an explicit definition of outcomes--a higher score indicates presence of more of these features in the trials appraised	2
Homogeneity or Reproducibility	Similar direction of findings among trials--a higher score indicates greater similarity of direction of findings among trials	2
Adequacy of control group	Extent to which the control group presented standard of care (large dissimilarities=1, minor dissimilarities=2, usual care=3)	1
Biological Plausibility	Consistent with understanding of mechanistic and previous clinical work (large inconsistencies=1, minimal consistencies=2, very consistent=3)	2
Generalizability	Likelihood of trial findings being replicated in other settings (low likelihood i.e. single centre=1, moderate likelihood i.e. multicentre with limited patient population or practice setting=2, high likelihood i.e. multicentre, heterogenous patients, diverse practice settings=3)	2
Low cost	Estimated cost of implementing the intervention listed--a higher score indicates a lower cost to implement the intervention in an average ICU	1
Feasible	Ease of implementing the intervention listed--a higher score indicates greater ease of implementing the intervention in an average ICU	2
Safety	Estimated probability of avoiding any significant harm that may be associated with the intervention listed--a higher score indicates a lower probability of harm	1

## 8.0 Parenteral Nutrition vs. Standard care

January 31<sup>st</sup> 2009

**Question:** Compared to standard care (IV fluids, oral diet, etc.), does parenteral nutrition (PN) result in improved clinical outcomes in critically ill patients with an intact GI tract?

**Summary of Evidence:** From on a recent meta-analysis of PN vs. standard care in critically ill and surgical patients (Heyland et al, JAMA 1998 Dec 16;280(23):2013-9), there were 6 out of 26 studies that included patients that would routinely be admitted to the ICU as part of their management. Two of these trials evaluated the use of combination EN + PN and hence were excluded from this section and incorporated into section 7.0 (combination EN + PN). There were 4 level 2 studies that were reviewed and one level 2 study additional study published since the meta-analysis.

**Mortality:** When the 5 studies from this review were aggregated, PN had no effect on mortality (RR 0.82, 0.42, 1.61,  $p = 0.56$ ) (figure 1).

**Infections:** Only one study (Sax 1987) reported the number of patients with infectious complications and parenteral nutrition was associated with an increase in infectious complications (14.0 vs. 4.0%,  $p=0.36$ ).

**LOS and Ventilator days:** Based on 4 studies that reported hospital length of stay, the use of parenteral nutrition had no effect on hospital stay (Weighted mean difference, WMD 0.51, -6.93, 7.95,  $p = 0.89$ ) (figure 2). Two studies reported on ventilator days and found no differences between the groups.

**Other:** An improvement in nitrogen balance in the PN groups was noted in some studies (Abel, Sax, Reilly). Two studies reported higher costs associated with the use of parenteral nutrition. The use of PN was also associated with a higher incidence of other complications (pneumonia, respiratory failure, acute renal failure and catheter related sepsis).

### Conclusions:

- 1) Parenteral nutrition has no effect on mortality in critically ill patients
- 2) Parenteral nutrition may be associated with an increase in complications in critically ill patients.
- 3) Parenteral nutrition has no effect on hospital stay.

*Level 1 study: if all of the following are fulfilled: concealed randomization, blinded outcome adjudication and an intention to treat analysis.*

*Level 2 study: If any one of the above characteristics are unfulfilled.*

Table 1. Randomized studies evaluating parenteral nutrition vs. standard care in critically ill patients

Study	Population	Methods (score)	Intervention	Mortality # (%)†		Infections # (%)‡	
				PN	control	PN	control
1) Abel 1976	Malnourished cardiac surgery patients N = 44	C.Random: not sure ITT: no Blinding: no (4)	PN without lipids after surgery vs D5W	4/20 (20)	3/24 (12.5)	NA	NA
